# Integration & Authentication Health Check ✓

Regularly reviewing key elements in your evolving Workday environment is critical to ensure effective integrations and maintain overall integration landscape health. Poorly performing integrations can be especially disruptive to your business operations and your organization's reputation.

## Our Solution

Intecrowd will review your integrations, focusing on commonly seen problem areas. These areas include long-running integrations, expiring schedules and security keys, inappropriate data access levels, and integrations with high warning or error counts, to name a few. We will make quick fixes as appropriate, and provide you with a summary analysis and a plan to address our findings.

## We'll examine the following:

- Single Sign On (SSO) or Multifactor Authentication (MFA) configuration
- Currently active Authentication Policies
- Analysis of Signons and Attempted Signons report
- Integration system users (ISUs) and service accounts (ISSGs) for best practice permissions
- Integration run-time events with high or unusual error or warning counts
- Long-running integrations for potential performance enhancements
- Expiring integration schedules and expiring keys to decrease possible data feed interruptions

## Benefits:

- ☑ Lowered costs and less rework due to fewer data-level errors.

- ☑ Peace of mind from improved data security.

- ☑ Increased satisfaction of customers, vendors, and employees through efficient integration delivery.

- ☑ Increased confidence in Workday and the HR Technology organization
